

In Progress

- ❑ Document the all the workflows in the vault repo
 - Group by modules
 - See sample mermaid code output

Pending

Easy

☐ Fix search bar icons on search input fields overlapping with input text

- One in customer login/signup
- Admin settings > promos config page
- Admin settings > services and packages page

☐ Make settings modal fullscreen

- Settings sidebar should be a second sidebar
- Auto collapses the dashboard sidebar when settings opened

Hard

- ☐ Vet type staff should have some sort of specialization (e.g. respiratory, cardio, etc.)
 - This should be shown in booking process > staff picker
 - This should also influence what kind of services they offer
 - These services should be readonly if initial consultation service has not been used by the customer
 - So for vet type staff, I assume the booking process would be: branch > pet > service type > staff and time pickers > services/packages... or should it be different?
 - Services prices are TBD, only estimated prices on payment stage, should be editable by the assigned vet after or during pet treatment
-

- ☐ Fix facebook signup
 - Test in mom's or james email
-

- ☐ Change Resend to Brevo in code
 - Free email
 - No need for domain
 - create document in claude on how to setup step by step
-

- ☐ Try ollama integration in the system
- ☐ Add on screen tutorials for customer and each staff role
 - Should dim entire screen except for next step UI
 - Next, Previous and Skip buttons
 - Can be activated again by interacting with a floating dog mascot (from landing page)

Golden Fur — Advisory Session Review

Source: MsMayuga-URO-Aug27 (advisor walkthrough transcript)

Prepared for: dev team backlog / Architectural Change Suggestions log

Part 1 — Issues Raised During the Session

The advisor (Ms. Mayuga) walked through a live demo of the Golden Fur booking system. The issues below are organized by area, as surfaced during that walkthrough.

A. Payment & Compliance

1. PayMongo requires business verification (KYC).

When the team attempted to log into PayMongo with the Golden Fur account, the platform required ID/business verification (Know Your Customer) before payment processing could be enabled, since PayMongo is a licensed payment portal. This requirement was not identified prior to the capstone proposal being finalized, so it wasn't accounted for in the original scope.

2. Facebook Login requires Meta Business Verification.

Similarly, enabling Facebook Login (Meta for Developers) requires Meta Business Verification once the app is live to the public. This is a second compliance dependency the team was not previously aware of.

3. Down payment was configured per-service instead of per-transaction.

During testing, the down payment toggle was found to apply at the individual service level rather than across the entire transaction. Per the proposal's scope, the down payment requirement should apply to all online payments/bookings as a whole.

B. Booking Flow

4. Reschedule allows selecting a date before the current booking's day.

While testing reschedule, a 'previous day' option remained selectable even though the booking had already been moved to a later date. Once a booking is moved forward, earlier dates (already past) should no longer be selectable.

5. Multi-day (3-day) booking configuration may not be working consistently.

A minimum-3-days filter/configuration was tested (e.g., Sept 1–3), but the advisor and dev noted it might not be functioning properly, and that schedules appeared to be 'pinned' or locked in an unexpected way.

6. A newly created service type did not appear in the booking flow.

A new 'Massage' service was created and marked available for both branches, but it did not show up in the 'Book a Service' step/menu during the customer booking flow.

7. The system only supports booking one pet at a time.

Customers with multiple pets cannot book services for more than one pet within the same session (e.g., one pet for Makati, another for Southwoods, or two pets at the same branch). For hotel-type bookings specifically, only one cage can be assigned per booking, so multiple pets cannot each be

assigned their own cage in a single transaction. The advisor acknowledged this is a nontrivial database/architecture challenge, not just a UI fix.

C. Services & Packages

8. Running total miscalculates when an individual service overlaps with a package.

When a service that also exists inside a selected package was chosen individually, the displayed price did not update correctly (e.g., showed 750 instead of the expected 630) until the conflicting selection was manually removed.

9. Unclear selection order and labeling between individual services and packages.

When a service is already part of a selected package, it becomes disabled — but it isn't clearly labeled with which package it belongs to, making the code/reasoning hard to read. The advisor also raised the open question of whether individual services or packages should be the default/first thing a customer selects.

D. Cancellations & Credits

10. Cancellation always converts payment to a full (100%) credit, with no configurable option.

The system currently performs a full conversion of payment to customer credit upon cancellation. The advisor suggested this should be configurable (e.g., an admin-defined percentage, such as 50%, returned as credit instead of the full amount).

11. Credits were not generated correctly during a cancel/reschedule test.

While testing the cancel-then-reschedule path, no credit appeared to have been generated from the cancelled/down-paid booking, which should have converted per policy.

E. Environment & Deployment

12. The system is still running on localhost, limiting real-world testing.

The advisor pointed out that because the system has not yet been deployed to a live environment, certain payment- and integration-related behaviors (e.g., PayMongo, OAuth logins) cannot be fully verified end-to-end.

Part 2 — Actionable Dev Notes

The items below translate the issues above into a checklist, formatted consistently with the team's Architectural-Change-Suggestions log.

On PayMongo integration (payment settings):

- ☐ Coordinate with the business owner (Sir Mike) to complete PayMongo's Business Verification / KYC requirements before continuing integration work.
- ☐ Prepare and store the required verification documents (business permit, IDs, etc.) in the shared Google Drive per PayMongo's checklist.
- ☐ Define a fallback plan/scope in case business verification is denied or delayed (e.g., cash-only or manual payment recording as an interim option).

On Facebook Login (Meta OAuth):

- ☐ Confirm with the business owner whether pursuing Meta Business Verification for Facebook Login is worth the added compliance overhead.
- ☐ If deprioritized, update the proposal/scope documentation to reflect Google/Gmail OAuth as the primary third-party login method, with Facebook as optional/future work.

On admin settings → down payment configuration:

- ☐ Move the down payment toggle/config so it applies per transaction (all online bookings/services), not per individual service.
- ☐ Re-test down payment enforcement across grooming, hotel, daycare, and vet booking types after the fix.

On staff/customer reschedule flow:

- ☐ Disable date options earlier than the booking's current effective date in the reschedule date picker.
- ☐ Add a regression test: after moving a booking to a later date, confirm the previously available earlier dates are no longer selectable.

On multi-day (hotel) booking configuration:

- ☐ Investigate and fix the 3-day-minimum (or N-day) booking filter/configuration — verify it correctly applies date ranges instead of appearing to lock/pin schedules.
- ☐ Add test cases covering multi-day ranges (e.g., 3 nights, 5 nights) to confirm no unintended schedule locking.

On Book a Service step (customer/staff booking flow):

- ☐ Fix the bug preventing a newly created and activated service type from appearing in the service selection list.
- ☐ Add a QA checklist step: verify any new service is immediately visible/selectable in the booking flow once marked active.

On booking process — multi-pet / multi-branch support:

- ☐ Document the current one-pet-per-booking-session limitation as a known constraint if it will not be resolved within capstone scope.
- ☐ If pursued, scope a design for handling multiple pets within one session as sequential per-pet bookings (not true simultaneous multi-select), reusing shared booking context (date range, branch) where applicable.
- ☐ For hotel-type bookings specifically, resolve the cage-assignment limitation so multiple pets in one transaction can each be assigned a separate cage.

On service/package selection UI (booking → services step):

- ☐ When a service is disabled because it's already included in a selected package, show a label or tooltip naming that package (not just a greyed-out state).
- ☐ Fix the running-total computation bug that occurs when a service overlaps between an individual selection and a package selection.
- ☐ Decide and document the intended UX order (individual service selection vs. package selection first) and apply it consistently across the booking flow.

On cancellation policy (admin settings → maintenance → policies):

- ☐ Add a configurable cancellation-to-credit conversion rate (default 100%, admin-adjustable, e.g. down to 50%) instead of a hardcoded full conversion.
- ☐ Fix the bug where credits were not generated after a cancellation during testing — verify the down-payment-to-credit pipeline end-to-end.
- ☐ Re-verify that the reschedule flow correctly reflects updated booking status and resulting credit balance after a cancellation.

Deployment / test environment:

- ☐ Deploy the system to a live/staging environment (beyond localhost) to properly test payment provider integrations (PayMongo) and OAuth logins end-to-end.
- ☐ Confirm seeded test data remains usable and realistic once migrated to the live/staging environment.
